

Order Management API Documentation

Introduction

Welcome to the Order Management API. This API allows you to submit orders, cancel orders, Get order, Search orders and update shipping address/method within our system. The API is organized around REST and uses standard HTTPS methods to interact with resources. [JSON](#) is returned by all API responses, including errors.

Usage of these environments is dependent on having a valid API key. Please refer to below section Authentication on how to obtain such a key.

Authentication

All our Order Management API calls will require you to have a valid API token or API-KEY and provide it in the header of each call. All communication is done through [HTTPS](#) and calls made over plain HTTP will fail.

Authenticate using API key:

- API Key will be shared as part of the onboarding process.
- URLs for Submit and Cancel orders will also be provided during the onboarding process. The base URL starts with: <https://api.partner-connect.io/api/{partner-prefix}/endpoint/>
- Once you have a key, you would send that using the [X-API-KEY](#) header.
 - To add the X-API-KEY use the following format: key:secret

Rate limits

Rate limits are restrictions that our API imposes on the number of times a user or client can access our services within a specified period of time. All of these requests count towards your personal rate limit of **100 requests per second**.

Why do we have rate limits?

Rate limits are a common practice for APIs, and they're put in place for a few different reasons:

- They help protect against abuse or misuse of the API. For example, a malicious actor could flood the API with requests in an attempt to overload it or cause disruptions in service. By setting rate limits, we can prevent this kind of activity.
- Rate limits help ensure that everyone has fair access to the API. If one person or organization makes an excessive number of requests, it could bog down the API for

everyone else. By throttling the number of requests that a single user can make, it ensures that the most number of people have an opportunity to use the API without experiencing slowdowns.

Retry logic

If an API rate limit is exceeded, you will often receive a **429 status code**. To avoid impact to your workloads, you should proactively implement retry techniques. The following techniques increase the reliability of your application.

- **Retry:** It is a strategy designed to handle situations where HTTP requests might fail due to intermittent issues or temporary connectivity problems. This mechanism ensures that failed requests are automatically reattempted, thereby increasing the likelihood of a successful outcome. The retries can be executed immediately, or they can be spaced out over time for more persistent issues. Every API call should implement retry, in the application code where API calls are made.
- **Exponential backoff:** The idea behind exponential backoff is to use progressively longer waits between retries for consecutive error responses. Exponential backoff can lead to very long backoff times, because exponential functions grow quickly. You should implement a maximum delay interval and a maximum number of retries. The maximum delay interval and maximum number of retries are not necessarily fixed values. They should be set based on the operation being performed and other local factors, including network latency.
- **Jitter:** Retries can be ineffective if all clients retry at the same time. To avoid this problem, we employ jitter, a random amount of time before making or retrying a request to help prevent large bursts by spreading out the arrival rate. Most exponential backoff algorithms use jitter to prevent successive collisions.

For more information, including examples, see:

- [Exponential backoff and jitter](#) blog post
- Examples of backoff and jitter using [Python](#)

Errors

The Order Management API uses conventional HTTP response codes to indicate the success or failure of an API request. In general:

- Codes in the 2xx range indicate success.
- Codes in the 4xx range indicate a structural or data error in the request (e.g., a required parameter was omitted, referenced order was not found, etc.).
- Codes in the 5xx range indicate an error with Order Management API servers (these are rare).

Submit Order

Use the Submit order API to submit an order in 1 request.

POST /{submitOrderUrl}

For international orders:

Send retail product price and retail shipping price as:

- retailCurrency - currency which retail prices are provided in
- retailShippingPriceInclVat - shipping price **excluding** VAT (ignore the fact the parameter has suffix inclVAT)
- items[i].retailPriceInclVat - total product price **excluding** VAT (ignore the fact the parameter has suffix inclVAT)

BASE URL and **KEY** to be provided during the onboarding process.

Request example

```
curl--location
 '[BASE URL]/order'
--header 'Content-Type:application/json'\
--header 'X-API-KEY: [VALUE:KEY] '
--data-raw'
{
  "orderReferenceId": "test",
  "orderType": "order",
  "currency": "EUR",
  "retailCurrency": "GBP",
  "retailShippingPriceInclVat": 6.99,
  "shippingAddress": {
    "country": "SE",
    "firstName": "My first name",
    "lastName": "My last name",
    "addressLine1": "17",
    "addressLine2": "Address 1",
    "city": "City",
    "postCode": "11111",
    "state": "",
```

```
"email": "myemail@myemail.com",
"phone": "+47222222",
"companyName": "MyCompany"
},
"items": [
  {
    "itemReferenceId": "test1",
    "productUid":
"flat_product_pf_a4_pt_200-gsm-uncoated_cl_4-0_ct_none_prt_none_sft_none_set_none_hor",
    "quantity": 1,
    "files": [
      {
        "type": "default",
        "url":
"https://www.dropbox.com/s/crlac0ni3ezimsh/flat_product_pf_500x700-mm_pt_170-gsm-uncoated_cl_4-0_ct_none_prt_none_sft_none_set_none_ver.pdf?dl=1"
      }
    ]
  }
]
```

Response example

```
{
  "id": "32884a3e-bd09-42be-8225-c5cea7d24611",
  "orderReferenceId": "test",
  "createdAt": "2024-07-17T10:23:28+00:00"
}
```

Cancel Order

Use the Cancel order API to stop and cancel the production and shipment process. Note: Cancel order will be possible until the order has moved to status: [shipped](#).

The method will return status 200 in case of successful order cancellation OR error code with details.

Order Canceling by Order ID or Order Reference ID

POST `/ {orderCancelUrl}`

Note: This API call can handle either the Order ID (provided in the response when submitting the order) or the Order Reference ID (your internal order ID).

Request example for “Order ID”: `"32884a3e-bd09-42be-8225-c5cea7d24611"`

```
curl --location --request POST \  
'[BASE URL]/32884a3e-bd09-42be-8225-c5cea7d24611/cancel'  
--header 'X-API-KEY: [VALUE:KEY]'
```

OR

Request example for “Order Reference ID”: `"test"`

```
curl --location --request POST \  
'[BASE URL]/test/cancel'  
--header 'X-API-KEY: [VALUE:KEY]'
```

Response example:

```
{  
  "code": 200,  
  "message": "OK"  
}
```

Update Shipment

Use the Update Shipment API endpoint to modify the shipping method or update the shipping address until the order has moved to status “shipped”.

Note: This API call can handle either the Order ID (provided in the response when submitting the order) or the Order Reference ID (your internal order ID).

PUT /{updateShipmentURL}

Update Shipment request example

```
curl --location --request POST \  
--header 'x-api-key: key:secret' \  
--header 'Content-Type: application/json' \  
--data-raw \  
{  
  "shipmentMethodUid": "fed_ex_2_day",  
  "shippingAddress": {  
    "country": "GB",  
    "firstName": "Alexis",  
    "lastName": "Apollo",  
    "addressLine1": "Longusta str. 4",  
    "addressLine2": "app. 144",  
    "city": "myCity",  
    "postCode": "111111",  
    "state": "myState",  
    "email": "myemail@example.com",  
    "phone": "+34 111444111",  
    "companyName": "Company_example",  
    "isBusiness": false,  
    "federalTaxId": "",  
    "stateTaxId": "",  
    "registrationState": ""  
  }  
}
```

Update shipment response example

```
{  
  "shippingAddress": {  
    "id": "2f85d65b-4814-4b5f-90a2-a7de28250bd1",
```

```
    "orderId": "148c5a06-35c9-40d3-8ef7-e85eb2da317d",
    "country": "GB",
    "firstName": "Test Order",
    "lastName": "4",
    "companyName": "company_example",
    "addressLine1": "address example 1",
    "addressLine2": "address example 2",
    "city": "myCity",
    "postCode": "111111",
    "state": "",
    "email": "myEmail@example.com",
    "phone": "+34 111444222",
    "isBusiness": false,
    "federalTaxId": "",
    "stateTaxId": "",
    "registrationState": ""
  },
  "shipment": {
    "shipmentMethodUid": "fed_ex_2_day",
    "shipmentMethodName": "DHL Global Parcel",
    "fulfillmentCountry": "DE",
    "fulfillmentFacilityId": "db0622e7-d7af-4453-b39f-cdf1b67f3daa",
    "packageCount": 1,
    "initialMinDeliveryDate": "2024-11-16",
    "initialMaxDeliveryDate": "2024-11-16",
    "serviceType": "normal"
  }
}
```

Get Order

Use the Get Order API to retrieve order information.

GET `/getOrderURL`

Request example

```
curl --location --request GET \  
'[BASE URL]/{order_id}  
--header 'X-API-KEY: [VALUE:KEY]'
```

Response example

```
{  
  "id": "9f9ff09f-5891-4d3d-be35-9b302db835a1",

Search Orders

Use the Search Orders API to retrieve a list of orders.

POST /{searchOrdersURL}

Request example:

```
$ curl -X POST \
  '[BASE URL]/search' \
  -H 'Content-Type: application/json' \
  -H 'X-API-KEY: {{apiKey}}' \
  -d '{
    "fulfillmentStatuses": [
      "canceled",
      "delivered"
    ]
  }'
```

Response example:

```
{
  "orders": [
    {
      "id": "9f9ff09f-5891-4d3d-be35-9b302db835a1",
